

Forklift Fork Positioner

Fork Positioner for Forklifts - The fork positioner is a hydraulic device that allows the person driving to operate the forklift without leaving the seat. They are constructed out of high quality materials and are designed to endure the most demanding procedures and work surroundings. Side shifting units have the extra ability to laterally position the entire load or the arms so as to facilitate much more exact lifting and placement in a quicker and much more efficient manner.

The unique fork pocket design could enable the one operating it to be able to safely sway the unit's forks without any worry of destroying the positioning cylinders. This could allow the operator the choice to either execute independent or simultaneous blade movement, depending on the job requirement. For most forklifts with non-OEM carriages, complete carriages are necessary. Standard OEM carriages could be converted into blade positioners on available units.
